

Northwind Analytics - Incident Response Plan
(Fictitious document for demonstration purposes only.)

When an incident is declared, the incident response plan is executed in coordination with relevant third parties, including our managed security provider, affected clients, and, where required, regulators.

Incidents are declared by the on-call lead when adverse events meet the documented incident criteria.

The incident response team follows defined roles and a documented escalation path, and each incident is tracked to closure in the ticketing system.

Network Monitoring

The Security Operations Center monitors networks and network services and reviews intrusion detection system alerts to find potentially adverse events. Alerts are triaged every business day.

Recovery

Once recovery is initiated from the incident response process, systems are restored from the most recent verified backups. The recovery portion of the incident response plan was last exercised during a tabletop test in February, and the results were recorded.
